TEVA COMPLEX

ComPlex is a package of natural plant stimulants harvested from concentrates of desert plants. Added antioxidants in the product help your crop deal with stress better and make better use of PGRs the plant creates because of these stimulants. It's a safe and natural product that can help you promote growth in your crops the way that nature does.

Why use Teva Complex?

- A blend of natural stimulants that slow auxin movement and promote cytokinin production and movement, leading to increased cell division and elongation, the main drivers of plant growth.
- Added antioxidants help your crop deal with stress conditions that would lock hormones in place or get rid of them so that you have a longer window of use in the plant.
- The use of stimulants that cause the plant to produce its own PGRs which are active in the plant up to twice as long as synthetic PGRs.

What is Teva Complex?

- A blend of natural plant stimulants to regulate PGR movement in your plant specifically to increase growth of your crop.
- A blend of secondary PGRs such as jasmonates to help the plant deal stress conditions.
- An added antioxidant to further oxidize and deal with stress conditions plant is under.
- PGRs produced by your plant are natural and can work longer and more effectively in the plant than their synthetic counterparts.
